

KOSH Homepage Review — Part C: Analytics & Tracking

Missing integrations for understanding user behavior, measuring conversions, and legal compliance.

Total items: 10 | Current state: Only Vercel Web Vitals

C1. Current state: Almost nothing

The **only** analytics tool is **Vercel Analytics** (`@vercel/analytics` in `layout.tsx`) — provides basic Web Vitals only. No user behavior data, no conversion tracking, no error monitoring.

C2. Add Google Analytics 4 — P0 Must Have

File: `src/app/layout.tsx`

No GA4 integration. Zero insight into:

- Traffic sources (where users come from)
- Page views and bounce rates
- User flow through the site
- Conversion tracking (signups, contact form)

Implementation: Add GA4 script via `next/script` or through GTM container.

C3. Add Google Tag Manager — P0 Must Have

File: `src/app/layout.tsx`

No GTM. Without it, adding/updating tags requires code deploys. GTM allows marketing team to manage tags independently.

Implementation: Add GTM container script in `<head>` + noscript fallback in `<body>` .

C4. Add event tracking on CTA buttons — P0 Must Have

File: `src/components/ui/Button.tsx` or individual section files

No click tracking on any button. Key events to track:

- `cta_click` — every CTA button with label + page location
- `signup_start` — click on "Create Account"
- `contact_sales` — click on "Contact Sales"
- `download_app` — click on store badges
- `social_click` — social icon clicks with platform label

Implementation: Add `onClick` handler to Button component that fires GA4 events, or use GTM click triggers.

C5. Add section view tracking — P1 High

Track when each section enters the viewport:

- `section_view` — hero, tab_explainer, features, carousel, business_cta, faqs, footer
- `carousel_interact` — drag/click on feature carousel

- `faq_expand` — which FAQ questions users open

Implementation: Use `IntersectionObserver` (pattern already exists in `FourthSection`) to fire GA4 events.

C6. Add Microsoft Clarity — P1 Free, High Value

File: `src/app/layout.tsx`

Free heatmaps and session recordings. See exactly where users click, how far they scroll, and where they drop off.

Implementation: Single script tag in layout.

C7. Add Facebook/LinkedIn Pixels — P1 If Running Ads

File: `src/app/layout.tsx`

Can't retarget website visitors or track ad conversions without pixels. Add if running paid campaigns on these platforms.

C8. Add Sentry for error monitoring — P1 High

Files: `next.config.ts` , `src/app/layout.tsx`

No error tracking. Production errors go completely unnoticed — canvas sequence failures, API errors, broken interactions would be invisible.

Implementation: `@sentry/nextjs` package with Next.js integration.

C9. Add cookie consent banner — P1 Legal Requirement

File: New component + `src/app/layout.tsx`

No cookie consent implementation. Non-compliant with GDPR (EU users) and CCPA (California users).

Required before adding GA4, Clarity, or any pixel.

Implementation: Use CookieBot, OneTrust, or a lightweight custom banner that gates analytics script loading.

C10. Add email capture / lead magnet — P2 Nice to Have

No way to capture leads who aren't ready to sign up. Consider:

- Newsletter signup in footer
 - "Get early access" email field
 - Lead magnet (e.g., "Guide to stablecoin payments for freelancers")
-

Recommended Implementation Order

#	Tool	Purpose	Priority
1	Google Tag Manager	Centralized tag management	P0
2	Google Analytics 4 (via GTM)	Traffic, behavior, conversions	P0

3	CTA event tracking (via GTM)	Measure button clicks	P0
4	Cookie consent banner	GDPR/CCPA compliance	P1
5	Microsoft Clarity	Free heatmaps + recordings	P1
6	Sentry	Error monitoring	P1
7	Facebook/LinkedIn Pixel	Ad retargeting + conversion	P1 (if ads)
8	Email capture	Lead generation	P2

Summary: C2-C4 are must-haves before any marketing spend. C9 (cookie consent) is legally required before adding most tracking tools.
